Overview

This project proposes a small game about wanting to go on vacation. The main character tries to leave their small town by car, but are stopped by a construction crew who is finishing up the bridge's renovation. Their boss only needs to give the word to let us pass but he's missing, so we need to go find him if we want to go on vacation quickly. This is a quick sketch of the game's scenario.

Scenario

The game will be set in a **small town** surrounded by **a forest**, leaving the **bridge** as the only way to leave. The town itself is made up of some **houses**, a **restaurant**, a **park** and the **city council**, along with **roads** and **sidewalks**.

Modeling and animation

The main models to consider here are the houses, other buildings, cars and people. Most of these will be made by me by combining Three.js primitives, but I intend to use a blender model, made by me, or otherwise (with the necessary credit) for the people. In terms of animation, the people will have simple bone animations, while the other models that need animating will be animated within Three.js, as they are primitive models.

Illumination and Textures

The whole city will be illuminated by the sun, with the interiors having their own light as well. For the aesthetic I have in mind, most objects will make use of toon shaders (MeshToonMaterial), with few exceptions. I intend for select parts of the world to get light texturing (road, walls).

Interactivity

The game will be controlled in a first-person perspective, with the following controls:

- **WASD**: movement
- **Mouse**: camera movement
- **E**: interact with people and objects
